Sophos XG Firewall delivers the ultimate enterprise firewall performance, security, and control

- Fastpath packet optimisation technology with up to 140Gbps throughput
- Revolutionary Security Heartbeat™ for improved Advanced Threat Protection (ATP) and response
- Patented Layer-8 user identity control and visibility
- Unified App, Web, QoS, and IPS Policy simplifies management
- App risk factor and user threat quotient monitors risk levels

About Sophos XG Firewall

XG is a NGFW – next-generation-firewall – which combines elements of both Sophos and Cyberoam UTM and next-gen firewall technology but also completely new innovations and features that users have been requesting for some time.

What does Sophos Heartbeat do?

Finds the threat faster – threat indicators like suspicious network traffic are instantly shared between the Next-Gen Firewall and the Next-Gen Endpoint to detect and prevent attacks.

Simplifies investigation – active identification of compromised systems shares computer names, users and paths between Endpoint and Firewall, so you can take action quickly.

Minimise impact – compromised endpoints are automatically isolated by the firewall, while the endpoint terminates and removes malicious software.

Saves IT time and money – through automated incident response

Sophos XG has a new Firewall OS that takes care of:

Management – Firewall Management, Centralised Management, Status and Alerts, Reporting and Logging

User and App Control – User identity, Application Control, Web Control, Content Control

Protection – Firewall, IP Security (IPS), Anti-Malware, Web Protection, Synchronized Security, Advanced Threat Protection, Business Applications, Encrypted Traffic

Networking – Routing and bridging, Zone Segmentation, Traffic Shaping, Wireless Controller, Performance, VPN, RED VPN, IPv6.
